

THE SINGAPORE PARKING PROBLEM

Two lots, 200 m apart.
Five times the price.

Singapore parking fees swing wildly between a mall and the quiet lot around the corner – and no app shows the **true total fee** before you commit, GoPark crunches the real cost of every nearby option, ranks them by price or walk, and routes you straight to the gantry

LIVE QUOTE • SAME DESTINATION

2 HR PARK

MAJOR MALL

\$20.00

>

GOPARK FINDS

\$3.95

▼ YOU SAVE \$16.05 • 80% CHEAPER

Illustrative comparison – replace with a real measured trip before printing

THE PROBLEM

- \$

Drastic price variance
Identical trips costs wildly different amounts. Drivers default to the obvious, expensive mall lot – and **overpay every single time** without knowing a cheaper lot sits minutes away.
- Q

Rigid search
~~Parkopedia~~ demands an exact 6-digit postal code. **GoPark** accepts a mall, hospital, building, landmark – or a full address.

WHY GOPARK WINS

CAPABILITY	GOPARK	PARKOPEDIA	GOOGLE MAPS
Search by landmark or building name	●	—	◐
True total cost (time, duration, surcharges, flat rates)	●	—	—
Live lot availability	●	◐	—
Rank by price vs walking distance	●	—	—
One-tap route to the gantry	●	—	●
Built on SG-native data (LTA / HDB)	●	◐	◐

● full ◐ partial — none

USER STORIES

- I want to **search a landmark**, avoiding postal code lookups.
- I want to input my duration to see the absolute **cheapest options** nearby.
- I want to **sort by price vs walking distance** to make informed decision
- I want to **check live lot availability** to avoid queueing at full malls

BUILT RIGHT

- 🔗

Version control
Git/GitHub, feature branches, and PR code reviews before merge to main.
- 📈

Agile delivery
Work split into small task, weekly syncs, and continous feature testing.
- 🔒

Identity security
Cloudflare Turnstile, JWT sessions, Nodemailer OTP, and Bcrypt password hashing.

HOW THE ENGINE WORKS

- 🕒 01

Live availability
Pulls real-time lot capacity from HDB / LTA so you never circle a full structure.
- \$ 02

Dynamic costing
Computes the final fee from arrival time, duration, peak surcharges and hidden flat rates.
- 📍 03

Landmark search
Turns plain text like "Orchard Gateway" into GPS coordinates via OneMap SG geocoding.
- >_ 04

Route handoff
Sends coordinates to Google Maps / Waze, routing the driver right to the gantry entrance.
- 📊 05

Interactive filtering
Re-sorts the live map instantly between cheapest price and shortest walk.
- 🧠 06

AI data pipeline
An LLM scraper (Z.AI GLM / vLLM) plus cron jobs fold messy web rates and LTA DataMall v2 into the database.

SYSTEM ARCHITECTURE

WHAT'S NEXT

- ⚡

EV integration
Filter for lots that guarantee an available EV charging point.
- 🔔

Grace nudges
Push reminders before a 10-minute grace period or flat-rate window closes.
